Sharp glyph generation does not resolve uncertain semantic codes

a Same 16 question-image initial states

Same 16 initial states; complete answers are not scored here.
No form lookup at inference. First image F1 at least 0.95: 5/16.

b Semantic output-span regression limits

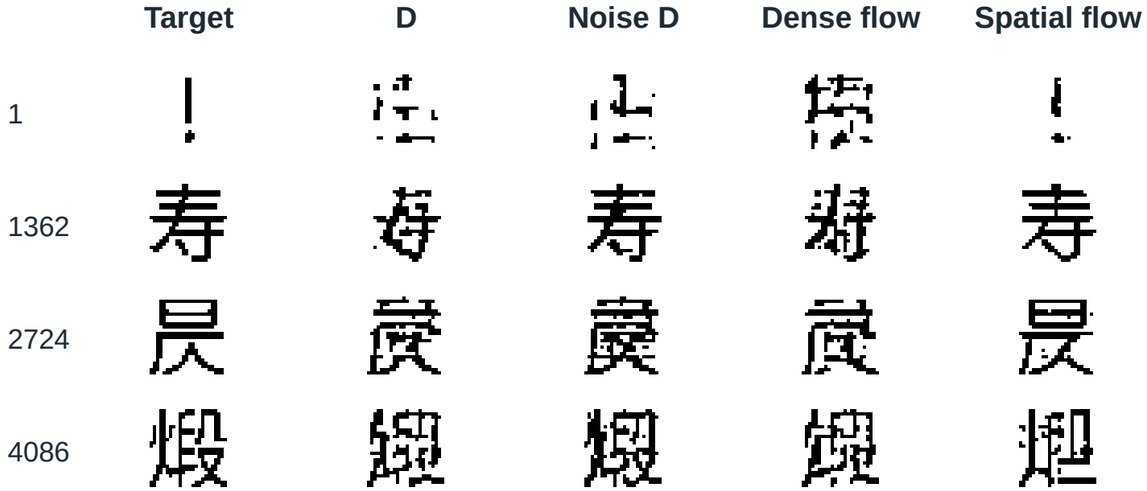

4,087 anchors; 2,048-dimensional affine output.
A latent regression bound, not a pixel or language-error bound.

c Physical glyph generation on known forms

Motor	Clean F1	Mixed F1
Noise-trained D	0.999752	0.822751
Dense motor flow	0.906284	0.715449
Spatial image flow	0.998260	0.810537

All rows assess 4,087 forms; training recipes and costs differ.
Every mixed-code gate fails; no autonomous QA follows these fits.

d Actual 55/45-mixture outputs, unrepaired

Fixed non-empty indices span the inventory. Complete 32 × 32 source pixels; no inferred or replacement strokes.
