Better training fidelity does not improve new-context image answers

a Clear complete answers on new contexts

New cohort: both questions correct 6/16 vs 5/16.
The one-answer difference is a conservative glyph reading.

b Training foreground F1 (%)

Training F1 0.963524 -> 0.999811; physical gate passes.
New-context canonical exact answers remain 2/32 each.

c Fixed reader → **Exact training-state cache** → **Balanced first/later writer fit** → **Actual pixels -> E -> next state**

d First eight reserved questions, both conditions, all outcomes retained

Question 00

Parent | n=2 stop

Balanced | n=2 stop

Question 02

Parent | n=3 stop

Balanced | n=3 stop

Question 04

Parent | n=64 cap | first 10

Balanced | n=7 stop

Question 06

Parent | n=64 cap | first 10

Balanced | n=29 stop | first 10

Question 01

Parent | n=3 stop

Balanced | n=3 stop

Question 03

Parent | n=6 stop

Balanced | n=6 stop

Question 05

Parent | n=64 cap | first 10

Balanced | n=64 cap | first 10

Question 07

Parent | n=64 cap | first 10

Balanced | n=64 cap | first 10

Unrepaired output pixels. Prefixes only where marked; full PNGs embedded. Agent reading is not independent human grading. Answer pilot remains failed.
